Write a Java program to get an integer number as input and display whether the digits in that number form an Ascending order or Descending order.

In cases where the digits don't follow neither ascending or descending order, the program should display " Not in an order ".

```
Input an Integer : 12345  
12345 is a Ascending Order
```

```
Input an Integer : 54321  
54321 is on Descending Order
```

```
Input an Integer : 3568634  
3568634 is not in an Order
```
