UML DIAGRAMS DAY 01 – ASSIGNMENT

The Cake Ordering System

The Cake Ordering System allows the user of a web browser to order cake for home delivery.

To place an order, a shopper searches to find items to purchase, adds items one at a time to a shopping cart, and possibly searches again for more items.

When all items have been chosen, the shopper provides a delivery address.
If not paying with cash, the shopper also provides credit card information.

The system has an option for shoppers to **register** with the cake shop.

They can then save their name and address information, so that they do not have to enter this information every time that they place an order.

Develop a use case diagram, for a use case for placing an order, Place Order.

The use case should show a relationship to two previously specified use cases, Identify Customer, which allows a user to register and log in, and Pay by Credit, which models credit card payments.
